Abstract

In this paper, we prove global weighted Lorentz and Lorentz-Morrey estimates for gradients of solutions to the quasilinear parabolic equations:

$$u_t - \operatorname{div}(A(x, t, \nabla u)) = \operatorname{div}(F),$$

in a bounded domain $\Omega \times (0, T) \subset \mathbb{R}^{N+1}$, under minimal regularity assumptions on the boundary of domain and on nonlinearity A . Then results yields existence of a solution to the Riccati type parabolic equations:

$$u_t - \operatorname{div}(A(x, t, \nabla u)) = |\nabla u|^q + \operatorname{div}(F) + \mu,$$

where $q > 1$ and μ is a bounded Radon measure.

MSC: primary 35K59; secondary 42B37

Keywords: quasilinear parabolic equations; maximal potential; Reifenberg flat domain; Morrey-Lorentz spaces; Riccati type equations; capacity.

1 Introduction and main results

In this article, we are concerned with the global weighted Lorentz space estimates for gradients of weak solutions to quasilinear parabolic equations in divergence form:

$$\begin{cases} u_t - \operatorname{div}(A(x, t, \nabla u)) = \operatorname{div}(F) & \text{in } \Omega_T, \\ u = 0 & \text{on } \partial_p(\Omega \times (0, T)), \end{cases} \quad (1.1)$$

where $\Omega_T := \Omega \times (0, T)$ is a bounded open subset of \mathbb{R}^{N+1} , $N \geq 2$, $\partial_p(\Omega \times (0, T)) = (\partial\Omega \times (0, T)) \cup (\Omega \times \{t = 0\})$, $F \in L^1(\Omega_T, \mathbb{R}^N)$ is a given vector field and the nonlinearity $A : \mathbb{R}^N \times \mathbb{R} \times \mathbb{R}^N \rightarrow \mathbb{R}^N$ is a Carathéodory vector valued function, i.e. A is measurable in (x, t) and continuous with respect to ∇u for a.e. (x, t) .

We suppose in this paper that A satisfies

$$|A(x, t, \zeta)| \leq \Lambda_1 |\zeta|, \quad (1.2)$$

and

$$\langle A(x, t, \zeta) - A(x, t, \xi), \zeta - \xi \rangle \geq \Lambda_2 |\zeta - \xi|^2, \quad (1.3)$$

*E-mail address: quoc-hung.nguyen@epfl.ch; Hung.Nguyen-Quoc@lmpt.univ-tours.fr

for every $(\xi, \zeta) \in \mathbb{R}^N \times \mathbb{R}^N$ and a.e. $(x, t) \in \mathbb{R}^N \times \mathbb{R}$, where Λ_1 and Λ_2 are positive constants. In addition, we also assume that the derivatives of A with respect to ζ are bounded, that is,

$$|A_\zeta(x, t, \zeta)| \leq \Lambda_1, \quad (1.4)$$

for any $\zeta \in \mathbb{R}^N$ and $(x, t) \in \mathbb{R}^N$. We remark that the condition (1.4) is needed in order to ensure that the reference problems (2.5) and (2.17) in the next section have $C^{0,1}$ regularity solutions (see [11, 12]), which will be used in the sequel.

Throughout the paper, we assume that A satisfies (1.2) and (1.3), (1.4). Besides, we always denote $T_0 = \text{diam}(\Omega) + T^{1/2}$ and $Q_\rho(x, t) = B_\rho(x) \times (t - \rho^2, t)$, $\tilde{Q}_\rho(x, t) = B_\rho(x) \times (t - \rho^2/2, t + \rho^2/2)$ for $(x, t) \in \mathbb{R}^{N+1}$ and $\rho > 0$.

A weak solution u of (1.1) is understood in the standard weak (distributional) sense, that is $u \in L^1(0, T, W_0^{1,1}(\Omega))$ is a weak solution of (1.1) if

$$-\int_{\Omega_T} u \varphi_t dx dt + \int_{\Omega_T} A(x, t, \nabla u) \nabla \varphi dx dt = -\int_{\Omega_T} F \nabla \varphi dx dt$$

for all $\varphi \in C_c^1([0, T] \times \Omega)$. The existence and uniqueness of weak solutions in $L^2(0, T, H_0^1(\Omega))$ to problem (1.1) with $F \in L^2(\Omega_T, \mathbb{R}^N)$ is given at the beginning of the next section.

For our purpose, we need a condition on Ω which is expressed in the following way. We say that Ω is a (δ, R_0) -Reifenberg flat domain for $\delta \in (0, 1)$ and $R_0 > 0$ if for every $x \in \partial\Omega$ and every $r \in (0, R_0]$, there exists a system of coordinates $\{z_1, z_2, \dots, z_n\}$, which may depend on r and x , so that in this coordinate system $x = 0$ and that

$$B_r(0) \cap \{z_n > \delta r\} \subset B_r(0) \cap \Omega \subset B_r(0) \cap \{z_n > -\delta r\}. \quad (1.5)$$

We notice that this class of flat domains is rather wide since it includes C^1 domains, Lipschitz domains with sufficiently small Lipschitz constants and even fractal domains. Besides, it has many important roles in the theory of minimal surfaces and free boundary problems. This class appeared first in a work of Reifenberg (see [20]) in the context of Plateau problem. Its properties can be found in [9, 10, 23].

We also require that the nonlinearity A satisfies a smallness condition of BMO type in the x -variable in the sense that $A(x, t, \zeta)$ satisfies a (δ, R_0) -BMO condition for some $\delta, R_0 > 0$ with exponent $p > 0$ if

$$[A]_p^{R_0} := \sup_{(y, s) \in \mathbb{R}^N \times \mathbb{R}, 0 < r \leq R_0} \left(\int_{Q_r(y, s)} (\Theta(A, B_r(y))(x, t))^p dx dt \right)^{\frac{1}{p}} \leq \delta,$$

where

$$\Theta(A, B_r(y))(x, t) := \sup_{\zeta \in \mathbb{R}^N \setminus \{0\}} \frac{|A(x, t, \zeta) - \bar{A}_{B_r(y)}(t, \zeta)|}{|\zeta|},$$

and $\bar{A}_{B_r(y)}(t, \zeta)$ is denoted the average of $A(t, \cdot, \zeta)$ over the ball $B_r(y)$, i.e.,

$$\bar{A}_{B_r(y)}(t, \zeta) := \int_{B_r(y)} A(x, t, \zeta) dx = \frac{1}{|B_r(y)|} \int_{B_r(y)} A(x, t, \zeta) dx.$$

The above condition appeared in our previous paper [19]. It is easy to see that the (δ, R_0) -BMO is satisfied when A is continuous or has small jump discontinuities with respect to x . We recall that a positive function $w \in L_{\text{loc}}^1(\mathbb{R}^{N+1})$ is called an \mathbf{A}_p weight, $1 \leq p < \infty$ if there holds

$$[w]_{\mathbf{A}_p} := \sup_{\tilde{Q}_\rho(x, t) \subset \mathbb{R}^{N+1}} \left(\int_{\tilde{Q}_\rho(x, t)} w(y, s) dy ds \right) \left(\int_{\tilde{Q}_\rho(x, t)} w(y, s)^{-\frac{1}{p-1}} dy ds \right)^{p-1} < \infty \quad \text{when } p > 1,$$

$$[w]_{\mathbf{A}_1} := \sup_{\tilde{Q}_\rho(x,t) \subset \mathbb{R}^{N+1}} \left(\int_{\tilde{Q}_\rho(x,t)} w(y,s) dy ds \right) \operatorname{ess\,sup}_{(y,s) \in \tilde{Q}_\rho(x,t)} \frac{1}{w(y,s)} < \infty \quad \text{when } p = 1.$$

The $[w]_{\mathbf{A}_p}$ is called the \mathbf{A}_p constant of w .

A positive function $w \in L^1_{\text{loc}}(\mathbb{R}^{N+1})$ is called an \mathbf{A}_∞ weight if there are two positive constants C and ν such that

$$w(E) \leq C \left(\frac{|E|}{|Q|} \right)^\nu w(Q),$$

for all cylinder $Q = \tilde{Q}_\rho(x,t)$ and all measurable subsets E of Q . The pair (C, ν) is called the \mathbf{A}_∞ constant of w and is denoted by $[w]_{\mathbf{A}_\infty}$. It is well known that this class is the union of \mathbf{A}_p for all $p \in (1, \infty)$, see [7].

If w is a weight function belonging to $w \in \mathbf{A}_\infty$ and $E \subset \mathbb{R}^{N+1}$ a Borel set, $0 < q < \infty$, $0 < s \leq \infty$, the weighted Lorentz space $L^{q,s}_w(E)$ is the set of measurable functions g on E such that

$$\|g\|_{L^{q,s}_w(E)} := \begin{cases} \left(q \int_0^\infty (\rho^q w(\{(x,t) \in E : |g(x,t)| > \rho\}))^{\frac{s}{q}} \frac{d\rho}{\rho} \right)^{1/s} < \infty & \text{if } s < \infty, \\ \sup_{\rho > 0} \rho (w(\{(x,t) \in E : |g(x,t)| > \rho\}))^{1/q} < \infty & \text{if } s = \infty. \end{cases}$$

Here we write $w(O) = \int_O w(x,t) dx dt$ for a measurable set $O \subset \mathbb{R}^{N+1}$. Obviously, $\|g\|_{L^{q,q}_w(E)} = \|g\|_{L^q_w(E)}$, thus $L^{q,q}_w(E) = L^q_w(E)$. As usual, when $w \equiv 1$ we write simply $L^{q,s}(E)$ instead of $L^{q,s}_w(E)$. In this paper, \mathcal{M} denotes the parabolic Hardy-Littlewood maximal function defined for each locally integrable function f in \mathbb{R}^{N+1} by

$$\mathcal{M}(f)(x,t) = \sup_{\rho > 0} \int_{\tilde{Q}_\rho(x,t)} |f(y,s)| dy ds \quad \forall (x,t) \in \mathbb{R}^{N+1}.$$

If $p > 1$ and $w \in \mathbf{A}_p$ we verify that \mathcal{M} is operator from $L^1(\mathbb{R}^{N+1})$ into $L^{1,\infty}(\mathbb{R}^{N+1})$ and $L^{p,s}_w(\mathbb{R}^{N+1})$ into itself for $0 < s \leq \infty$, see [21, 22, 24].

We would like to mention that the use of the Hardy-Littlewood maximal function in non-linear degenerate problems was started in the elliptic setting by T. Iwaniec in his fundamental paper [8].

We now state the main result of the paper.

Theorem 1.1 *Let $F \in L^2(\Omega_T, \mathbb{R}^N)$. There exists a unique weak solution $u \in L^2(0, T, H^1_0(\Omega))$ of (1.1). For any $w \in \mathbf{A}_\infty$, $0 < q < \infty$, $0 < s \leq \infty$ we find $\delta = \delta(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_\infty}) \in (0, 1)$ and $s_0 = s_0(N, \Lambda_1, \Lambda_2) > 0$ such that if Ω is (δ, R_0) -Reifenberg flat domain Ω and $[A]^{R_0}_{s_0} \leq \delta$ for some $R_0 > 0$ then*

$$\|\mathcal{M}(|\nabla u|^2)\|_{L^{q,s}_w(\Omega_T)} \leq C \|\mathcal{M}(|F|^2)\|_{L^{q,s}_w(\Omega_T)}. \quad (1.6)$$

Here C depends only on $N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_\infty}$ and T_0/R_0 .

Since \mathcal{M} is a bounded operator from $L^{p,s}_w(\mathbb{R}^{N+1})$ into itself for $p > 1, 0 < s \leq \infty$ and $w \in \mathbf{A}_p$, thus we obtain the following Theorem.

Theorem 1.2 *Let $F \in L^2(\Omega_T, \mathbb{R}^N)$ and s_0 be in Theorem 1.1. There exists a unique weak solution $u \in L^2(0, T, H^1_0(\Omega))$ of (1.1). For any $w \in \mathbf{A}_{q/2}$, $2 < q < \infty$, $0 < s \leq \infty$ we find $\delta = \delta(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}) \in (0, 1)$ and such that if Ω is (δ, R_0) -Reifenberg flat domain and $[A]^{R_0}_{s_0} \leq \delta$ for some $R_0 > 0$ then*

$$\|\nabla u\|_{L^{q,s}_w(\Omega_T)} \leq C \|F\|_{L^{q,s}_w(\Omega_T)}. \quad (1.7)$$

Here C depends only on $N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}$ and T_0/R_0 .

We remark that the global gradient estimates of solutions of (1.1) obtained in Theorem 1.2 extend results in [2, 3, 4] to more general nonlinear structure and in the setting of weighted Lorentz spaces. Notice that Theorem 1.1 and 1.2 in the quasilinear elliptic framework are obtained in [14].

In the linear case, we obtain global estimates for gradients of weak solutions to problem

$$\begin{cases} u_t - \operatorname{div}(A(x, t, \nabla u)) = \operatorname{div}(F) + \mu & \text{in } \Omega_T, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = \sigma & \text{in } \Omega, \end{cases} \quad (1.8)$$

where $F \in L^1(\Omega_T, \mathbb{R}^N)$, $\mu \in \mathfrak{M}_b(\Omega_T)$ the set of bounded Radon measure in Ω_T , $\sigma \in \mathfrak{M}_b(\Omega)$ the set of bounded Radon measure in Ω .

Theorem 1.3 *Suppose that A is linear. Let $F \in L^1(\Omega_T, \mathbb{R}^N)$, $\mu \in \mathfrak{M}_b(\Omega_T)$, $\sigma \in \mathfrak{M}_b(\Omega)$, set $\omega = |\mu| + |\sigma| \otimes \delta_{\{t=0\}}$. Let s_0 be as in Theorem 1.1.*

- a. *For any $q > 2$, $0 < s \leq \infty$, $w \in \mathbf{A}_{q/2}$ and $\mathcal{M}_1[\omega], |F| \in L_w^{q,s}(\Omega_T)$ we find a $\delta = \delta(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}) \in (0, 1)$ such that if Ω is a (δ, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta$ for some $R_0 > 0$ there exists a unique weak solution $u \in L^2(0, T, H_0^1(\Omega))$ of (1.8) and there holds*

$$||\nabla u||_{L_w^{q,s}(\Omega_T)} \leq C ||\mathcal{M}_1[\omega]||_{L_w^{q,s}(\Omega_T)} + C |||F|||_{L_w^{q,s}(\Omega_T)}, \quad (1.9)$$

where C depends only on $N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}$ and T_0/R_0 .

- b. *For any $\varepsilon \in (0, 1)$, $\frac{2(\varepsilon+1)}{\varepsilon+2} < q \leq 2$, $0 < s \leq \infty$, $w^{2+\varepsilon} \in \mathbf{A}_1$ and $\mathcal{M}_1[\omega], |F| \in L_w^{q,s}(\Omega_T)$ we find a $\delta = \delta(N, \Lambda_1, \Lambda_2, q, s, \varepsilon, [w^{2+\varepsilon}]_{\mathbf{A}_1}) \in (0, 1)$ such that if Ω is a (δ, R_0) -flat domain and $[A]_{s_0}^{R_0} \leq \delta$ for some $R_0 > 0$ there exists a unique weak solution $u \in L^{\frac{2(\varepsilon+1)}{\varepsilon+2}}(0, T, W_0^{1, \frac{2(\varepsilon+1)}{\varepsilon+2}}(\Omega))$ of (1.8) and there holds*

$$||\nabla u||_{L_w^{q,s}(\Omega_T)} \leq C ||\mathcal{M}_1[\omega]||_{L_w^{q,s}(\Omega_T)} + C |||F|||_{L_w^{q,s}(\Omega_T)}, \quad (1.10)$$

where C depends only on $N, \Lambda_1, \Lambda_2, q, s, \varepsilon, [w^{2+\varepsilon}]_{\mathbf{A}_1}$ and T_0/R_0 .

In above Theorem, \mathcal{M}_1 denotes the first order fractional Maximal parabolic potential on \mathbb{R}^{N+1} of a positive Radon measure in \mathbb{R}^{N+1} by

$$\mathcal{M}_1[\mu](x, t) = \sup_{0 < \rho < R} \frac{\mu(\tilde{Q}_\rho(x, t))}{\rho^{N+1}} \quad \forall (x, t) \in \mathbb{R}^{N+1}.$$

We can use estimates (1.7) in Theorem 1.2 and (1.9)-(1.10) in Theorem 1.3 and the following Lemma to get upper bounds for gradients of the solutions in Lorentz-Morrey spaces.

Lemma 1.4 *Let $0 < q < \infty$, $0 < s \leq \infty$, $\gamma \geq 1$ and H_1, H_2 be measurable functions in Ω_T . If*

$$||H_1||_{L_w^{q,s}(\Omega_T)} \leq C(N, q, s, [w^\gamma]_{\mathbf{A}_1}) ||H_2||_{L_w^{q,s}(\Omega_T)},$$

for any $w^\gamma \in \mathbf{A}_1$, then for any $\kappa \in \left(\frac{(N+2)(\gamma-1)}{\gamma}, N+2\right]$, $\vartheta \in \left(\frac{N(\gamma-1)}{\gamma}, N\right]$,

$$||H_1||_{L_*^{q,s;\kappa}(\Omega_T)} \leq C(N, q, s, \gamma, \kappa) ||H_2||_{L_*^{q,s;\kappa}(\Omega_T)}, \quad (1.11)$$

and

$$||H_1||_{L_{**}^{q,s;\vartheta}(\Omega_T)} \leq C(N, q, s, \gamma, \vartheta) ||H_2||_{L_{**}^{q,s;\vartheta}(\Omega_T)}. \quad (1.12)$$

In (1.11), $L_*^{q,s;\kappa}(\Omega_T)$ denotes Lorentz-Morrey space, is the set of measurable functions g in Ω_T such that

$$\|g\|_{L_*^{q,s;\kappa}(\Omega_T)} := \sup_{0 < \rho < T_0, (x,t) \in \Omega_T} \rho^{\frac{\kappa-N-2}{q}} \|g\|_{L^{q,s}(\tilde{Q}_\rho(x,t) \cap \Omega_T)} < \infty.$$

In (1.12), $L_{**}^{q,s;\vartheta}(\Omega_T)$ is the Lorentz-Morrey space of measurable functions g in Ω_T such that

$$\|g\|_{L_{**}^{q,s;\vartheta}(\Omega_T)} := \sup_{0 < \rho < \text{diam}(\Omega), x \in \Omega} \rho^{\frac{\vartheta-N}{q}} \|g\|_{L^{q,s}((B_\rho(x) \cap \Omega) \times (0,T))} < \infty.$$

This Lemma is inspired by [13, Proof of Theorem 2.3], its proof can be found in [19, Proof of Theorem 2.21] and notice that for $(x_0, t_0) \in \Omega_T$ and $0 < \rho < T_0$

$$\begin{aligned} w_1(x, t) &= \min\{\rho^{-N-2+\kappa-\kappa_1}, \max\{|x - x_0|, \sqrt{2|t - t_0|}\}^{-N-2+\kappa-\kappa_1}\}, \\ w_2(x, t) &= \min\{\rho^{-N+\vartheta-\vartheta_1}, |x - x_0|^{-N+\vartheta-\vartheta_1}\}, \end{aligned}$$

where $0 < \kappa_1 < \kappa - \frac{(N+2)(\gamma-1)}{\gamma}$, $0 < \vartheta_1 < \kappa - \frac{N(\gamma-1)}{\gamma}$ and

$$[w_1^\gamma]_{\mathbf{A}_1} \leq C(N, \kappa_1, \kappa, \gamma), \quad [w_2^\gamma]_{\mathbf{A}_1} \leq C(N, \vartheta_1, \vartheta, \gamma).$$

For example, from (1.9) in Theorem 1.3 and Lemma 1.4 we obtain for $2 < q < \infty$, $0 < s \leq \infty$ and $0 < \kappa \leq N + 2$, $0 < \vartheta \leq N + 2$ there hold

$$\begin{aligned} \|\nabla u\|_{L_*^{q,s;\kappa}(\Omega_T)} &\leq C\|\mathcal{M}_1[\omega]\|_{L_*^{q,s;\kappa}(\Omega_T)} + C\|F\|_{L_*^{q,s;\kappa}(\Omega_T)}, \\ \|\nabla u\|_{L_{**}^{q,s;\vartheta}(\Omega_T)} &\leq C\|\mathcal{M}_1[\omega]\|_{L_{**}^{q,s;\vartheta}(\Omega_T)} + C\|F\|_{L_{**}^{q,s;\vartheta}(\Omega_T)}, \end{aligned} \quad (1.13)$$

and from (1.10) in Theorem 1.3 we also have preceding estimates with $1 < q \leq 2$, $0 < s \leq \infty$ and $\frac{N+2}{2} < \kappa \leq N + 2$, $\frac{N}{2} < \vartheta \leq N$.

Furthermore, according to [19, Proof of Theorem 2.21] we verify that for $q > 1$, $0 < \vartheta < \min\{N, q\}$ and $\varphi \in L^1(0, T, W_0^{1,1}(\Omega))$ there holds

$$\left(\int_0^T |\text{osc}_{B_\rho \cap \overline{\Omega}} \varphi(t)|^q dt \right)^{\frac{1}{q}} \leq C \rho^{1-\frac{\vartheta}{q}} \|\nabla \varphi\|_{L_{**}^{q,q;\vartheta}(\Omega_T)}, \quad (1.14)$$

for any ball $B_\rho \subset \mathbb{R}^N$, where $C = C(N, q, \vartheta)$. Therefore, (1.13) implies a global Holder-estimate in space variable and L^q -estimate in time, namely for all ball $B_\rho \subset \mathbb{R}^N$

$$\left(\int_0^T |\text{osc}_{B_\rho \cap \overline{\Omega}} u(t)|^q dt \right)^{\frac{1}{q}} \leq C \rho^{1-\frac{\vartheta}{q}} \left(\|\mathcal{M}_1[\omega]\|_{L_{**}^{q,q;\vartheta}(\Omega_T)} + \|F\|_{L_{**}^{q,q;\vartheta}(\Omega_T)} \right),$$

with $0 < \vartheta < \min\{N, q\}$.

We would like to refer to [16, 17] as the first papers which have been used the first order fractional maximal operators in order to obtain the Lorentz-Morrey estimates for gradients of solutions to nonlinear elliptic equations with measure or L^1 data.

Finally, we use Theorem 1.3 to prove the existence of solutions of the Riccati type parabolic equations

$$\begin{cases} u_t - \text{div}(A(x, t, \nabla u)) = |\nabla u|^q + \text{div}(F) + \mu & \text{in } \Omega_T, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = \sigma & \text{in } \Omega, \end{cases} \quad (1.15)$$

where $q > 1$ and $F \in L^q(\Omega_T, \mathbb{R}^N)$, $\mu \in \mathfrak{M}_b(\Omega_T)$, $\sigma \in \mathfrak{M}_b(\Omega)$.

Theorem 1.5 Suppose that A is linear. Let $q > 1$, $F \in L^q(\Omega_T, \mathbb{R}^N)$ and $\mu \in \mathfrak{M}_b(\Omega_T)$, $\sigma \in \mathfrak{M}_b(\Omega)$, set $\omega = |\mu| + |\sigma| \otimes \delta_{\{t=0\}}$. There exist $C_1 = C_1(N, \Lambda_1, \Lambda_2, q, T_0)$, $\delta = \delta(N, \Lambda_1, \Lambda_2, q) \in (0, 1)$ and $s_0 = s_0(N, \Lambda_1, \Lambda_2) > 0$ such that if Ω is a (δ, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta$ for some $R_0 > 0$ and

$$\omega(K) \leq C_1 \text{Cap}_{\mathcal{G}_1, q'}(K), \quad (1.16)$$

and

$$\int_K H_q dx dt \leq C_1^q \text{Cap}_{\mathcal{G}_1, q'}(K), \quad (1.17)$$

for any compact set $K \subset \mathbb{R}^N$ where $H_q = (\mathcal{M}(|F|^2))^{q/2} \chi_{\Omega_T}$ if $q \geq \frac{N+2}{N}$ and $H_q = |F|^q \chi_{\Omega_T}$ if $q < \frac{N+2}{N}$, then problem (1.15) has a weak solution $u \in L^q(0, T, W_0^{1, q}(\Omega))$ satisfying

$$\int_{K \cap \Omega_T} |\nabla u|^q dx dt \leq C_2 \text{Cap}_{\mathcal{G}_1, q'}(K),$$

for any compact set $K \subset \mathbb{R}^N$, here $C_2 = C_2(N, \Lambda_1, \Lambda_2, q, T_0/R_0, T_0, C_1) > 0$.

In this Theorem, capacity $\text{Cap}_{\mathcal{G}_1, q'}$ denotes the (\mathcal{G}_1, q') -capacity where \mathcal{G}_1 is the Bessel parabolic kernel of first order (see [1])

$$\mathcal{G}_1(x, t) = \left((4\pi)^{N/2} \Gamma(1/2) \right)^{-1} \frac{\chi_{(0, \infty)}(t)}{t^{(N+1)/2}} \exp \left(-t - \frac{|x|^2}{4t} \right) \quad \text{for } (x, t) \text{ in } \mathbb{R}^{N+1}.$$

It is defined by

$$\text{Cap}_{\mathcal{G}_1, q'}(E) = \inf \left\{ \int_{\mathbb{R}^{N+1}} |f|^{q'} dx dt : f \in L_+^{q'}(\mathbb{R}^{N+1}), \mathcal{G}_1 * f \geq \chi_E \right\},$$

for any Borel set $E \subset \mathbb{R}^{N+1}$, where χ_E is the characteristic function on E . Note that if $1 < q < \frac{N+2}{N+1}$, the capacity $\text{Cap}_{\mathcal{G}_1, q'}$ of a singleton is positive thus (1.16) and (1.17) hold for some constant $C_1 > 0$ provided $\mu \in \mathfrak{M}_b(\Omega_T)$, $u_0 \in \mathfrak{M}_b(\Omega)$ and $|F| \in L^q(\Omega_T)$.

We remark that in case $F \equiv 0$ the existence of solutions to (1.15) has been obtained in our paper [19].

Remark 1.6 The inequality (1.16) is equivalent to

$$|\mu|(K) \leq C \text{Cap}_{\mathcal{G}_1, q'}(K), \quad \sigma \equiv 0 \text{ when } q \geq 2, \quad (1.18)$$

$$|\mu|(K) \leq C \text{Cap}_{\mathcal{G}_1, q'}(K), \quad |\sigma|(O) \leq \text{Cap}_{\mathbf{G}_{\frac{2-q}{q}}, q'}(O) \text{ when } 1 < q < 2, \quad (1.19)$$

for any compact sets $K \subset \mathbb{R}^{N+1}$, $O \subset \mathbb{R}^N$, where $\mathbf{G}_{\frac{2-q}{q}}$ is the Bessel kernel of order $\frac{2-q}{q}$ and capacity $\text{Cap}_{\mathbf{G}_{\frac{2-q}{q}}, q'}$ of O is defined by

$$\text{Cap}_{\mathbf{G}_{\frac{2-q}{q}}, q'}(O) = \inf \left\{ \int_{\mathbb{R}^N} |f|^{q'} dx : f \in L_+^{q'}(\mathbb{R}^N), \mathbf{G}_{\frac{2-q}{q}} * f \geq \chi_O \right\},$$

see [19, Remark 4.34]. Moreover, if $q > 2$, the inequality (1.17) is equivalent to

$$\int_{K \cap \Omega_T} |F|^q dx dt \leq C \text{Cap}_{\mathcal{G}_1, q'}(K),$$

for any compact set $K \subset \mathbb{R}^N$, see Lemma 4.1.

2 Interior estimates and boundary estimates for parabolic equations

In this section we present various local interior and boundary estimates for weak solution u of (1.1). They will be used for our global estimates later. First we recall basic existence and uniqueness result of problem (1.1).

Proposition 2.1 *If $F \in L^2(\Omega_T, \mathbb{R}^N)$, there exists a unique weak solution $u \in L^2(0, T; H_0^1(\Omega))$ of (1.1) and the following global estimate holds:*

$$\int_{\Omega_T} |\nabla u|^2 dx dt \leq \Lambda_2^{-1/2} \int_{\Omega_T} |F|^2 dx dt. \quad (2.1)$$

The existence and uniqueness of a weak solution of problem (1.1) with $F \in L^2(\Omega_T, \mathbb{R}^N)$ is obtained from the Lax-Milgram Theorem, version for parabolic framework. Using u as a test function in (1.1), we get (2.1). Moreover, due to the embedding

$$\{\varphi : \varphi \in L^2(0, T; H_0^1(\Omega)), \varphi_t \in L^2(0, T; H^{-1}(\Omega))\} \subset C(0, T; L^2(\Omega)),$$

thus, the unique weak solution u of (1.1) belongs to $C(0, T; L^2(\Omega))$. We can see that u is also the unique weak solution of (1.1) in $\Omega \times (-\infty, T)$ where $F \in L^2(\Omega_T, \mathbb{R}^N)$ and $F = 0, u = 0$ in $\Omega \times (-\infty, 0)$.

For some technical reasons, throughout this section, we always assume that $u \in C(-\infty, T; L^2(\Omega)) \cap L^2(-\infty, T; H_0^1(\Omega))$ is a weak solution to equation (1.1) in $\Omega \times (-\infty, T)$ with $F \in L^2(\Omega_T, \mathbb{R}^N)$, $F = 0$ in $\Omega \times (-\infty, 0)$.

2.1 Interior Estimates

For each ball $B_{2R} = B_{2R}(x_0) \subset \subset \Omega$ and $t_0 \in (0, T)$, one considers the unique solution

$$w \in C(t_0 - 4R^2, t_0; L^2(B_{2R})) \cap L^2(t_0 - 4R^2, t_0; H^1(B_{2R}))$$

to the following equation

$$\begin{cases} w_t - \operatorname{div}(A(x, t, \nabla w)) = 0 & \text{in } Q_{2R}, \\ w = u & \text{on } \partial_p Q_{2R}, \end{cases} \quad (2.2)$$

where $Q_{2R} = B_{2R} \times (t_0 - 4R^2, t_0)$ and $\partial_p Q_{2R} = (\partial B_{2R} \times (t_0 - 4R^2, t_0)) \cup (B_{2R} \times \{t = t_0 - 4R^2\})$. The following a variant of Gehring's lemma was proved in [18, 6].

Lemma 2.2 *Let w be in (2.2). There exist constants $\theta_1 > 2$ and C depending only on N, Λ_1, Λ_2 such that the following estimate*

$$\left(\int_{Q_{\rho/2}(y, s)} |\nabla w|^{\theta_1} dx dt \right)^{\frac{1}{\theta_1}} \leq C \int_{Q_{\rho}(y, s)} |\nabla w| dx dt, \quad (2.3)$$

holds for all $Q_{\rho}(y, s) \subset Q_{2R}$.

The next lemma gives an estimate for $\nabla u - \nabla w$.

Lemma 2.3 *Let w be in (2.2). There exists a constant $C = C(N, \Lambda_1, \Lambda_2) > 0$ such that*

$$\int_{Q_{2R}} |\nabla u - \nabla w|^2 dx dt \leq C \int_{Q_{2R}} |F|^2 dx dt. \quad (2.4)$$

Proof. Using $u - w$ as a test function in (1.1) and (2.2) and since

$$\int_{Q_{2R}} u_t(u - w) dx dt - \int_{Q_{2R}} w_t(u - w) dx dt = \frac{1}{2} \int_{B_{2R}} (u - w)^2(t_0) dx \geq 0,$$

we find

$$\int_{Q_{2R}} \langle A(x, t, \nabla u) - A(x, t, \nabla w), \nabla u - \nabla w \rangle dx dt \leq \int_{Q_{2R}} \langle F, \nabla u - \nabla w \rangle dx dt.$$

Using (1.3) and Hölder inequality we derive (2.4). ■

To continue, we denote by v the unique function

$$v \in C(t_0 - R^2, t_0; L^2(B_R)) \cap L^2(t_0 - R^2, t_0; H^1(B_R))$$

solution of the following equation

$$\begin{cases} v_t - \operatorname{div}(\bar{A}_{B_R(x_0)}(t, \nabla v)) = 0 & \text{in } Q_R, \\ v = w & \text{on } \partial_p Q_R, \end{cases} \quad (2.5)$$

where $Q_R = B_R(x_0) \times (t_0 - R^2, t_0)$ and $\partial_p Q_R = (\partial B_R \times (t_0 - R^2, t_0)) \cup (B_R \times \{t = t_0 - R^2\})$.

Lemma 2.4 *Let θ_1 be the constant in Lemma 2.2. There exist constants $C_1 = C_1(N, \Lambda_1, \Lambda_2)$ and $C_2 = C_2(\Lambda_1, \Lambda_2)$ such that*

$$\int_{Q_R} |\nabla w - \nabla v|^2 dx dt \leq C_1 ([A]_{s_1}^R)^2 \int_{Q_{2R}} |\nabla w|^2 dx dt, \quad (2.6)$$

with $s_1 = \frac{2\theta_1}{\theta_1 - 2}$ and

$$C_2^{-1} \int_{Q_R} |\nabla v|^2 dx dt \leq \int_{Q_R} |\nabla w|^2 dx dt \leq C_2 \int_{Q_R} |\nabla v|^2 dx dt. \quad (2.7)$$

Proof. The proof can be found in [19, Lemma 7.3]. ■

Theorem 2.5 *Let θ_1 be the constant in Lemma 2.2. There exists a functions $v \in C(t_0 - R^2, t_0; L^2(B_R)) \cap L^2(t_0 - R^2, t_0; H^1(B_R)) \cap L^\infty(t_0 - \frac{1}{4}R^2, t_0; W^{1,\infty}(B_{R/2}))$ such that*

$$\|\nabla v\|_{L^\infty(Q_{R/2})}^2 \leq C \int_{Q_{2R}} |\nabla u|^2 dx dt + C \int_{Q_{2R}} |F|^2 dx dt, \quad (2.8)$$

and

$$\int_{Q_R} |\nabla u - \nabla v|^2 dx dt \leq C \int_{Q_{2R}} |F|^2 dx dt + C ([A]_{s_1}^R)^2 \left(\int_{Q_{2R}} |\nabla u|^2 dx dt + \int_{Q_{2R}} |F|^2 dx dt \right), \quad (2.9)$$

where $s_1 = \frac{2\theta_1}{\theta_1 - 2}$ and $C = C(N, \Lambda_1, \Lambda_2)$.

Proof. Let w and v be in equations (2.2) and (2.5). By standard interior regularity and inequality (2.3) in Lemma 2.2 and (2.7) in Lemma 2.4 we have

$$\begin{aligned} \|\nabla v\|_{L^\infty(Q_{R/2})} &\leq C \left(\int_{Q_R} |\nabla v|^2 dx dt \right)^{1/2} \\ &\leq C \left(\int_{Q_R} |\nabla w|^2 dx dt \right)^{1/2}. \end{aligned}$$

Thus, we get (2.8) from inequality (2.4) in Lemma 2.3.

On the other hand, applying (2.6) in Lemma 2.4 yields

$$\int_{Q_R} |\nabla u - \nabla v|^2 dx dt \leq \int_{Q_R} |\nabla u - \nabla w|^2 dx dt + c_4 ([A]_{s_1}^R)^2 \int_{Q_{2R}} |\nabla w|^2 dx dt.$$

Hence, we get (2.9) from (2.4) in Lemma 2.3. The proof is complete. ■

2.2 Boundary Estimates

In this subsection, we focus on the corresponding estimates near the boundary.

Throughout this subsection, we always assume that Ω is a (δ, R_0) -Reifenberg flat domain with $0 < \delta \leq 1/2$. In particular, we can see that the complement of Ω is uniformly 2-thick for some constants c_0, r_0 , see [19]. Let $x_0 \in \partial\Omega$ be a boundary point and $0 < R < R_0/6$ and $t_0 \in (0, T)$, we set $\tilde{\Omega}_{6R} = \tilde{\Omega}_{6R}(x_0, t_0) = (\Omega \cap B_{6R}(x_0)) \times (t_0 - (6R)^2, t_0)$ and $Q_{6R} = Q_{6R}(x_0, t_0)$.

We now consider the unique solution w to the equation

$$\begin{cases} w_t - \operatorname{div}(A(x, t, \nabla w)) = 0 & \text{in } \tilde{\Omega}_{6R}, \\ w = u & \text{on } \partial_p \tilde{\Omega}_{6R}. \end{cases} \quad (2.10)$$

In what follows we extend F and u by zero to $(\Omega \times (-\infty, T))^c$ and then extend w by u to $\mathbb{R}^{N+1} \setminus \tilde{\Omega}_{6R}$.

Lemma 2.6 *Let w be in (2.10). There exist constants $\theta_2 > 2$ and $C > 0$ depending only on N, Λ_1, Λ_2 such that the following estimate*

$$\left(\int_{Q_{\rho/2}(y, s)} |\nabla w|^{\theta_2} dx dt \right)^{\frac{1}{\theta_2}} \leq C \int_{Q_{3\rho}(y, s)} |\nabla w| dx dt, \quad (2.11)$$

holds for all $Q_{3\rho}(z, s) \subset Q_{6R}$.

Above lemma was proved in [19, Theorem 7.5]. Analogous to Lemma 2.3 we obtain

Lemma 2.7 *Let w be in (2.10). There exists a constant $C = C(N, \Lambda_1, \Lambda_2) > 0$ such that*

$$\int_{Q_{6R}} |\nabla u - \nabla w|^2 dx dt \leq C \int_{Q_{6R}} |F|^2 dx dt. \quad (2.12)$$

Next, we set $\rho = R(1 - \delta)$ so that $0 < \rho/(1 - \delta) < R_0/6$. By the definition of Reifenberg flat domains, there exists a coordinate system $\{y_1, y_2, \dots, y_N\}$ with the origin $0 \in \Omega$ such that in this coordinate system $x_0 = (0, \dots, 0, -\rho\delta/(1 - \delta))$ and

$$B_\rho^+(0) \subset \Omega \cap B_\rho(0) \subset B_\rho(0) \cap \{y = (y_1, y_2, \dots, y_N) : y_N > -2\rho\delta/(1 - \delta)\}.$$

Since $\delta < 1/2$ we have

$$B_\rho^+(0) \subset \Omega \cap B_\rho(0) \subset B_\rho(0) \cap \{y = (y_1, y_2, \dots, y_N) : y_N > -4\rho\delta\}, \quad (2.13)$$

where $B_\rho^+(0) := B_\rho(0) \cap \{y = (y_1, y_2, \dots, y_N) : y_N > 0\}$.

Furthermore we consider the unique solution

$$v \in C(t_0 - \rho^2, t_0; L^2(\Omega \cap B_\rho(0))) \cap L^2(t_0 - \rho^2, t_0; H^1(\Omega \cap B_\rho(0)))$$

to the following equation

$$\begin{cases} v_t - \operatorname{div}(\bar{A}_{B_\rho(0)}(t, \nabla v)) = 0 & \text{in } \tilde{\Omega}_\rho(0), \\ v = w & \text{on } \partial_p \tilde{\Omega}_\rho(0), \end{cases} \quad (2.14)$$

where $\tilde{\Omega}_\rho(0) = (\Omega \cap B_\rho(0)) \times (t_0 - \rho^2, t_0)$ ($0 < t_0 < T$).

We put $v = w$ outside $\tilde{\Omega}_\rho(0)$. As Lemma 2.4 we have the following result.

Lemma 2.8 *Let θ_2 be the constant in Lemma 2.6. There exist positive constants $C_1 = C_1(N, \Lambda_1, \Lambda_2)$ and $C_2 = C_2(\Lambda_1, \Lambda_2)$ such that*

$$\int_{Q_\rho(0, t_0)} |\nabla w - \nabla v|^2 dx dt \leq C_1 ([A]_{s_2}^R)^2 \int_{Q_\rho(0, t_0)} |\nabla w|^2 dx dt, \quad (2.15)$$

with $s_1 = \frac{2\theta_2}{\theta_2-2}$ and

$$C_2^{-1} \int_{Q_\rho(0,t_0)} |\nabla v|^2 dxdt \leq \int_{Q_\rho(0,t_0)} |\nabla w|^2 dxdt \leq C_2 \int_{Q_\rho(0,t_0)} |\nabla v|^2 dxdt. \quad (2.16)$$

We can see that if the boundary of Ω is irregular enough, then the L^∞ -norm of ∇v up to $\partial\Omega \cap B_\rho(0) \times (t_0 - \rho^2, t_0)$ may not exist. For our purpose, we will consider another equation:

$$\begin{cases} V_t - \operatorname{div}(\bar{A}_{B_\rho(0)}(t, \nabla V)) = 0 & \text{in } Q_\rho^+(0, t_0), \\ V = 0 & \text{on } T_\rho(0, t_0), \end{cases} \quad (2.17)$$

where $Q_\rho^+(0, t_0) = B_\rho^+(0) \times (t_0 - \rho^2, t_0)$ and $T_\rho(0, t_0) = Q_\rho(0, t_0) \cap \{x_N = 0\}$.

A weak solution V of above problem is understood in the following sense: the zero extension of V to $Q_\rho(0, t_0)$ is in $C(t_0 - \rho^2, t_0; L^2(B_\rho(0))) \cap L_{\text{loc}}^2(t_0 - \rho^2, t_0; H^1(B_\rho(0)))$ and for every $\varphi \in C_c^1(Q_\rho^+(0, t_0))$ there holds

$$- \int_{Q_\rho^+(0, t_0)} V \varphi_t dxdt + \int_{Q_\rho^+(0, t_0)} \bar{A}_{B_\rho(0)}(t, \nabla V) \nabla \varphi dxdt = 0.$$

We have the following L^∞ gradient estimate up to the boundary for V . The following Lemma was obtained in [19, Lemma 7.12].

Lemma 2.9 *For any $\varepsilon > 0$ there exists a small $\delta_0 = \delta_0(N, \Lambda_1, \Lambda_2, \varepsilon) \in (0, 1/2)$ such that if $v \in C(t_0 - \rho^2, t_0; L^2(\Omega \cap B_\rho(0))) \cap L^2(t_0 - \rho^2, t_0; H^1(\Omega \cap B_\rho(0)))$ is a solution of (2.14) and under condition (2.13) with $\delta \in (0, \delta_0)$, there exists a weak solution $V \in C(t_0 - \rho^2, t_0; L^2(B_\rho^+(0))) \cap L^2(t_0 - \rho^2, t_0; H^1(B_\rho^+(0)))$ of (2.17), whose zero extension to $Q_\rho(0, t_0)$ satisfies*

$$\begin{aligned} \|\nabla V\|_{L^\infty(Q_{\rho/4}(0, t_0))}^2 &\leq C \int_{Q_\rho(0, t_0)} |\nabla v|^2 dxdt, \\ \int_{Q_{\rho/8}(0, t_0)} |\nabla v - \nabla V|^2 dxdt &\leq \varepsilon^2 \int_{Q_\rho(0, t_0)} |\nabla v|^2 dxdt, \end{aligned}$$

for some $C = C(N, \Lambda_1, \Lambda_2) > 0$.

Theorem 2.10 *Let s_2 be as in Lemma 2.8. For any $\varepsilon > 0$ there exists a small $\delta_0 = \delta_0(N, \Lambda_1, \Lambda_2, \varepsilon) \in (0, 1/2)$ such that the following holds. If Ω is a (δ, R_0) -Reifenberg flat domain with $\delta \in (0, \delta_0)$, there is a function $V \in L^2(t_0 - (R/9)^2, t_0; H^1(B_{R/9}(x_0))) \cap L^\infty(t_0 - (R/9)^2, t_0; W^{1,\infty}(B_{R/9}(x_0)))$ such that*

$$\|\nabla V\|_{L^\infty(Q_{R/9}(x_0, t_0))}^2 \leq C \int_{Q_{6R}(x_0, t_0)} |\nabla u|^2 dxdt + C \int_{Q_{6R}(x_0, t_0)} |F|^2 dxdt, \quad (2.18)$$

and

$$\begin{aligned} &\int_{Q_{R/9}(x_0, t_0)} |\nabla u - \nabla V|^2 dxdt \\ &\leq C(\varepsilon^2 + ([A]_{s_2}^{R_0})^2) \int_{Q_{6R}(x_0, t_0)} |\nabla u|^2 dxdt + C(\varepsilon^2 + 1 + ([A]_{s_2}^{R_0})^2) \int_{Q_{6R}(x_0, t_0)} |F|^2 dxdt, \end{aligned} \quad (2.19)$$

for some $C = C(N, \Lambda_1, \Lambda_2) > 0$.

Proof. Let $x_0 \in \partial\Omega$, $0 < t_0 < T$ and $\rho = R(1 - \delta)$, we may assume that $0 \in \Omega$, $x_0 = (0, \dots, -\delta\rho/(1 - \delta))$ and

$$B_\rho^+(0) \subset \Omega \cap B_\rho(0) \subset B_\rho(0) \cap \{x_N > -4\rho\delta\}. \quad (2.20)$$

We have also

$$Q_{R/9}(x_0, t_0) \subset Q_{\rho/8}(0, t_0) \subset Q_{\rho/4}(0, t_0) \subset Q_\rho(0, t_0) \subset Q_{6\rho}(0, t_0) \subset Q_{6R}(x_0, t_0), \quad (2.21)$$

provided that $0 < \delta < 1/625$.

Let w and v be as in Lemma 2.7 and Lemma 2.8. By Lemma 2.9 for any $\varepsilon > 0$ we can find a small positive $\delta = \delta(N, \Lambda_1, \Lambda_2, \varepsilon) < 1/625$ such that there is a function $V \in L^2(t_0 - \rho^2, t_0; H^1(B_\rho(0))) \cap L^\infty(t_0 - \rho^2, t_0; W^{1,\infty}(B_\rho(0)))$ satisfying

$$\begin{aligned} \|\nabla V\|_{L^\infty(Q_{\rho/4}(0, t_0))}^2 &\leq c_1 \int_{Q_\rho(0, t_0)} |\nabla v|^2 dx dt, \\ \int_{Q_{\rho/8}(0, t_0)} |\nabla v - \nabla V|^2 &\leq \varepsilon^2 \int_{Q_\rho(0, t_0)} |\nabla v|^2 dx dt. \end{aligned}$$

Then, by (2.16) in Lemma 2.8 and (2.21) we get

$$\begin{aligned} \|\nabla V\|_{L^\infty(Q_{R/9}(x_0, t_0))}^2 &\leq c_2 \int_{Q_\rho(0, t_0)} |\nabla w|^2 dx dt \\ &\leq c_3 \int_{Q_{6R}(x_0, t_0)} |\nabla w|^2 dx dt, \end{aligned} \quad (2.22)$$

and

$$\int_{Q_{R/9}(x_0, t_0)} |\nabla v - \nabla V|^2 dx dt \leq c_4 \varepsilon^2 \int_{Q_{6R}(x_0, t_0)} |\nabla w|^2 dx dt. \quad (2.23)$$

Therefore, from (2.12) in Lemma 2.7 and (2.22) we get (2.18).

Next we prove (2.19). Since (2.21), we have

$$\begin{aligned} \int_{Q_{R/9}(x_0, t_0)} |\nabla u - \nabla V|^2 dx dt &\leq c_5 \int_{Q_{\rho/8}(0, t_0)} |\nabla u - \nabla V|^2 dx dt \\ &\leq c_6 \int_{Q_{\rho/8}(0, t_0)} |\nabla u - \nabla w|^2 dx dt + c_6 \int_{Q_{\rho/8}(0, t_0)} |\nabla w - \nabla v|^2 dx dt \\ &\quad + c_6 \int_{Q_{\rho/8}(0, t_0)} |\nabla v - \nabla V|^2 dx dt. \end{aligned}$$

Using (2.12) in Lemma 2.7 and (2.15), (2.16) in Lemma 2.8 and (2.23) we find that

$$\begin{aligned} \int_{Q_{\rho/8}(0, t_0)} |\nabla u - \nabla w|^2 dx dt &\leq c_6 \int_{Q_{6R}(x_0, t_0)} |F|^2 dx dt, \\ \int_{Q_{\rho/8}(0, t_0)} |\nabla v - \nabla w|^2 dx dt &\leq c_7 ([A]_{s_2}^{R_0})^2 \int_{Q_{6R}(0, t_0)} |\nabla w|^2 dx dt \\ &\leq c_8 ([A]_{s_2}^{R_0})^2 \left(\int_{Q_{6R}(x_0, t_0)} |\nabla u|^2 dx dt + \int_{Q_{6R}(x_0, t_0)} |F|^2 dx dt \right), \end{aligned}$$

and

$$\int_{Q_{\rho/8}(0, t_0)} |\nabla v - \nabla V|^2 dx dt \leq c_9 \varepsilon^2 \left(\int_{Q_{6R}(x_0, t_0)} |\nabla u|^2 dx dt + \int_{Q_{6R}(x_0, t_0)} |F|^2 dx dt \right).$$

Then we derive (2.19). This completes the proof. ■

3 Global integral gradient bounds for parabolic equations

The following good- λ type estimate will be essential for our global estimates later.

Theorem 3.1 *Let s_1, s_2 be as in Lemma 2.4, 2.8 and $s_0 = \max\{s_1, s_2\}$. Let $w \in \mathbf{A}_\infty$, $F \in L^2(\Omega_T, \mathbb{R}^N)$. Let $u \in L^2(0, T; H_0^1(\Omega))$ be the weak solution to equation (1.1) in Ω_T . For any $\varepsilon > 0, R_0 > 0$ one finds $\delta_1 = \delta_1(N, \Lambda_1, \Lambda_2, \varepsilon, [w]_{\mathbf{A}_\infty}) \in (0, 1/2)$ and $\delta_2 = \delta_2(N, \Lambda_1, \Lambda_2, \varepsilon, [w]_{\mathbf{A}_\infty}, T_0/R_0) \in (0, 1)$ and $\Lambda = \Lambda(N, \Lambda_1, \Lambda_2) > 0$ such that if Ω is a (δ_1, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta_1$ then*

$$w(\{\mathcal{M}(|\nabla u|^2) > \Lambda\lambda, \mathcal{M}(|F|^2) \leq \delta_2\lambda\} \cap \Omega_T) \leq B\varepsilon w(\{\mathcal{M}(|\nabla u|^2) > \lambda\} \cap \Omega_T) \quad (3.1)$$

for all $\lambda > 0$, where the constant B depends only on $N, \Lambda_1, \Lambda_2, T_0/R_0, [w]_{\mathbf{A}_\infty}$.

To prove above estimate, we will use L. Caddarelli and I. Peral's technique in [5]. Namely, it is based on the following technical lemma whose proof is a consequence of Lebesgue Differentiation Theorem and the standard Vitali covering lemma, can be found in [3, 15] with some modifications to fit the setting here.

Lemma 3.2 *Let Ω be a (δ, R_0) -Reifenberg flat domain with $\delta < 1/4$ and let w be an \mathbf{A}_∞ weight. Suppose that the sequence of balls $\{B_r(y_i)\}_{i=1}^L$ with centers $y_i \in \overline{\Omega}$ and radius $r \leq R_0/4$ covers Ω . Set $s_i = T - ir^2/2$ for all $i = 0, 1, \dots, [\frac{2T}{r^2}]$. Let $E \subset F \subset \Omega_T$ be measurable sets for which there exists $0 < \varepsilon < 1$ such that $w(E) < \varepsilon w(\tilde{Q}_r(y_i, s_j))$ for all $i = 1, \dots, L, j = 0, 1, \dots, [\frac{2T}{r^2}]$; and for all $(x, t) \in \Omega_T, \rho \in (0, 2r]$, we have $\tilde{Q}_\rho(x, t) \cap \Omega_T \subset F$ if $w(E \cap \tilde{Q}_\rho(x, t)) \geq \varepsilon w(\tilde{Q}_\rho(x, t))$. Then $w(E) \leq \varepsilon B w(F)$ for a constant B depending only on N and $[w]_{\mathbf{A}_\infty}$.*

Proof of Theorem 3.1. Note that $[A]_{s_1}^{R_0}, [A]_{s_2}^{R_0} \leq [A]_{s_0}^{R_0}$. Let $\varepsilon \in (0, 1)$. Set $E_{\lambda, \delta_2} = \{\mathcal{M}(|\nabla u|^2) > \Lambda\lambda, \mathcal{M}(|F|^2) \leq \delta_2\lambda\} \cap \Omega_T$ and $F_\lambda = \{\mathcal{M}(|\nabla u|^2) > \lambda\} \cap \Omega_T$ for $\delta_2 \in (0, 1), \Lambda > 0$ and $\lambda > 0$. Let $\{y_i\}_{i=1}^L \subset \Omega$ and a ball B_0 with radius $2T_0$ such that

$$\Omega \subset \bigcup_{i=1}^L B_{r_0}(y_i) \subset B_0,$$

where $r_0 = \min\{R_0/1080, T_0\}$. Let $s_j = T - jr_0^2/2$ for all $j = 0, 1, \dots, [\frac{2T}{r_0^2}]$ and $Q_{2T_0} = B_0 \times (T - 4T_0^2, T)$. So,

$$\Omega_T \subset \bigcup_{i,j} Q_{r_0}(y_i, s_j) \subset Q_{2T_0}.$$

We verify that

$$w(E_{\lambda, \delta_2}) \leq \varepsilon w(\tilde{Q}_{r_0}(y_i, s_j)) \quad \forall \lambda > 0 \quad (3.2)$$

for some δ_2 small enough depending on $n, p, \alpha, \beta, \varepsilon, [w]_{\mathbf{A}_\infty}, T_0/R_0$.

In fact, we can assume that $E_{\lambda, \delta_2} \neq \emptyset$ so $\int_{\Omega_T} |F|^2 dx dt \leq c_1 |Q_{2T_0}| \delta_2 \lambda$. Recalling that \mathcal{M} is a bounded operator from $L^1(\mathbb{R}^{N+1})$ into $L^{1,\infty}(\mathbb{R}^{N+1})$, we find

$$|E_{\lambda, \delta_2}| \leq \frac{c_2}{\Lambda\lambda} \int_{\Omega_T} |\nabla u|^2 dx dt.$$

Using (2.1) in Proposition 2.1, we get

$$\begin{aligned} |E_{\lambda, \delta_2}| &\leq \frac{c_3}{\Lambda\lambda} \int_{\Omega_T} |F|^2 dx dt \\ &\leq c_4 \delta_2 |Q_{2T_0}|, \end{aligned}$$

which implies

$$w(E_{\lambda, \delta_2}) \leq C \left(\frac{|E_{\lambda, \delta_2}|}{|Q_{2T_0}|} \right)^\nu w(Q_{2T_0}) \leq C (c_4 \delta_2)^\nu w(Q_{2T_0}),$$

where $(C, \nu) = [w]_{\mathbf{A}_\infty}$. It is well-known that (see, e.g [7]) there exist $C_1 = C_1(N, C, \nu)$ and $\nu_1 = \nu_1(N, C, \nu)$ such that

$$\frac{w(\tilde{Q}_{2T_0})}{w(\tilde{Q}_{r_0}(y_i, s_j))} \leq C_1 \left(\frac{|\tilde{Q}_{2T_0}|}{|\tilde{Q}_{r_0}(y_i, s_j)|} \right)^{\nu_1} \quad \forall i, j.$$

Therefore,

$$w(E_{\lambda, \delta_2}) \leq C (c_4 \delta_2)^\nu C_1 \left(\frac{|\tilde{Q}_{2T_0}|}{|\tilde{Q}_{r_0}(y_i, s_j)|} \right)^{\nu_1} w(\tilde{Q}_{r_0}(y_i, s_j)) < \varepsilon w(\tilde{Q}_{r_0}(y_i, s_j)) \quad \forall i, j,$$

where $\delta_2 \leq \varepsilon^{1/\nu} (2CC_1 c_4^\nu (T_0 r_0^{-1})^{(N+2)\nu_1})^{-1/\nu}$. Thus (3.2) follows.

Next we verify that for all $(x, t) \in \Omega_T$, $r \in (0, 2r_0]$ and $\lambda > 0$ we have $\tilde{Q}_r(x, t) \cap \Omega_T \subset F_\lambda$ provided

$$w(E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)) \geq \varepsilon w(Q_r(x, t)),$$

for some $\delta_2 \leq \min \left\{ 1, \varepsilon^{1/\nu} (2CC_1 c_4^\nu (T_0 r_0^{-1})^{(N+2)\nu_1})^{-1/\nu} \right\}$. Indeed, take $(x, t) \in \Omega_T$ and $0 < r \leq 2r_0$. Now assume that $\tilde{Q}_r(x, t) \cap \Omega_T \cap F_\lambda^c \neq \emptyset$ and $E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t) \neq \emptyset$ i.e, there exist $(x_1, t_1), (x_2, t_2) \in \tilde{Q}_r(x, t) \cap \Omega_T$ such that $\mathcal{M}(|\nabla u|^2)(x_1, t_1) \leq \lambda$ and $\mathcal{M}(|F|^2)(x_2, t_2) \leq \delta_2 \lambda$. We need to prove that

$$w(E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)) < \varepsilon w(\tilde{Q}_r(x, t)). \quad (3.3)$$

Using $\mathcal{M}(|\nabla u|^2)(x_1, t_1) \leq \lambda$, we can see that

$$\mathcal{M}(|\nabla u|^2)(y, s) \leq \max \left\{ \mathcal{M} \left(\chi_{\tilde{Q}_{2r}(x, t)} |\nabla u|^2 \right) (y, s), 3^{N+2} \lambda \right\} \quad \forall (y, s) \in \tilde{Q}_r(x, t).$$

Therefore, for all $\lambda > 0$ and $\Lambda \geq 3^{N+2}$,

$$E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t) = \left\{ \mathcal{M} \left(\chi_{\tilde{Q}_{2r}(x, t)} |\nabla u|^2 \right) > \Lambda \lambda, \mathcal{M}(|F|^2) \leq \delta_2 \lambda \right\} \cap \Omega_T \cap \tilde{Q}_r(x, t). \quad (3.4)$$

In particular, $E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t) = \emptyset$ if $\overline{B_{8r}}(x) \subset \subset \mathbb{R}^N \setminus \Omega$. Thus, it is enough to consider the case $B_{8r}(x) \subset \subset \Omega$ and the case $B_{8r}(x) \cap \Omega \neq \emptyset$.

First assume $B_{8r}(x) \subset \subset \Omega$. Let v be as in Theorem 2.5 with $Q_{2R} = Q_{8r}(x, t_0)$ and $t_0 = \min\{t + 2r^2, T\}$. We have

$$\|\nabla v\|_{L^\infty(Q_{2r}(x, t_0))}^2 \leq c_5 \int_{Q_{8r}(x, t_0)} |\nabla u|^2 dx dt + c_5 \int_{Q_{8r}(x, t_0)} |F|^2 dx dt, \quad (3.5)$$

and

$$\begin{aligned} \int_{Q_{4r}(x, t_0)} |\nabla u - \nabla v|^2 dx dt &\leq c_5 \int_{Q_{8r}(x, t_0)} |F|^2 dx dt \\ &\quad + c_5 ([A]_{s_1}^R)^2 \left(\int_{Q_{8r}(x, t_0)} |\nabla u|^2 dx dt + \int_{Q_{8r}(x, t_0)} |F|^2 dx dt \right). \end{aligned}$$

Thanks to $\mathcal{M}(|\nabla u|^2)(x_1, t_1) \leq \lambda$ and $\mathcal{M}(|F|^2)(x_2, t_2) \leq \delta_2 \lambda$ with $(x_1, t_1), (x_2, t_2) \in Q_r(x, t)$, we find $Q_{8r}(x, t_0) \subset \tilde{Q}_{17r}(x_1, t_1), \tilde{Q}_{17r}(x_2, t_2)$ and

$$\begin{aligned} \|\nabla v\|_{L^\infty(Q_{2r}(x, t_0))}^2 &\leq c_6 \int_{\tilde{Q}_{17r}(x_1, t_1)} |\nabla u|^2 dx dt + c_6 \int_{\tilde{Q}_{17r}(x_2, t_2)} |F|^2 dx dt \\ &\leq c_6 (1 + \delta_2) \lambda \\ &\leq c_7 \lambda, \end{aligned} \quad (3.6)$$

and

$$\begin{aligned} \int_{Q_{4r}(x, t_0)} |\nabla u - \nabla v|^2 dx dt &\leq c_8 \delta_2 \lambda + c_5 ([A]_{s_0}^{R_0})^2 (1 + \delta_2) \lambda \\ &\leq c_9 (\delta_2 + \delta_1^2 (1 + \delta_2)) \lambda. \end{aligned} \quad (3.7)$$

Here we used $[A]_{s_0}^{R_0} \leq \delta_1$ in the last inequality.

In view of (3.6) we see that for $\Lambda \geq \max\{3^{N+2}, 4c_7\}$,

$$|\{\mathcal{M}(\chi_{\tilde{Q}_{2r}(x, t)} |\nabla v|^2) > \Lambda \lambda / 4\} \cap \tilde{Q}_r(x, t)| = 0.$$

Leads to

$$|E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)| \leq |\{\mathcal{M}(\chi_{\tilde{Q}_{2r}(x, t)} |\nabla u - \nabla v|^2) > \Lambda \lambda / 4\} \cap \tilde{Q}_r(x, t)|.$$

Therefore, by bound of operator \mathcal{M} from $L^1(\mathbb{R}^{N+1})$ to $L^{1, \infty}(\mathbb{R}^{N+1})$ and (3.7), $\tilde{Q}_{2r}(x, t) \subset Q_{4r}(x, t_0)$ we deduce

$$\begin{aligned} |E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)| &\leq \frac{c_{10}}{\lambda} \int_{\tilde{Q}_{2r}(x, t)} |\nabla u - \nabla v|^2 dx dt \\ &\leq c_{11} (\delta_2 + \delta_1^2 (1 + \delta_2)) |Q_r(x, t)|. \end{aligned}$$

Thus,

$$\begin{aligned} w(E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)) &\leq C \left(\frac{|E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)|}{|Q_r(x, t)|} \right)^\nu w(\tilde{Q}_r(x, t)) \\ &\leq C (c_{11} (\delta_2 + \delta_1^2 (1 + \delta_2)))^\nu w(\tilde{Q}_r(x, t)) \\ &< \varepsilon w(\tilde{Q}_r(x, t)). \end{aligned}$$

where δ_2, δ_1 are appropriately chosen and $(C, \nu) = [w]_{\mathbf{A}_\infty}$.

Next assume $B_{8r}(x) \cap \Omega \neq \emptyset$. Let $x_3 \in \partial\Omega$ such that $|x_3 - x| = \text{dist}(x, \partial\Omega)$. Set $t_0 = \min\{t + 2r^2, T\}$. We have

$$Q_{2r}(x, t_0) \subset Q_{10r}(x_3, t_0) \subset Q_{540r}(x_3, t_0) \subset \tilde{Q}_{1080r}(x_3, t) \subset \tilde{Q}_{1088r}(x, t) \subset \tilde{Q}_{1089r}(x_1, t_1), \quad (3.8)$$

and

$$Q_{540r}(x_3, t_0) \subset \tilde{Q}_{1080r}(x_3, t) \subset \tilde{Q}_{1088r}(x, t) \subset \tilde{Q}_{1089r}(x_2, t_2). \quad (3.9)$$

Let V be as in Theorem 2.10 with $Q_{6R} = Q_{540r}(x_3, t_0)$ and $\varepsilon = \delta_3 \in (0, 1)$. We have

$$\|\nabla V\|_{L^\infty(Q_{10r}(x_3, t_0))}^2 \leq c_{12} \int_{Q_{540r}(x_3, t_0)} |\nabla u|^2 dx dt + c_{12} \int_{Q_{540r}(x_3, t_0)} |F|^2 dx dt,$$

and

$$\begin{aligned} &\int_{Q_{10r}(x_3, t_0)} |\nabla u - \nabla V|^2 dx dt \\ &\leq c_{12} (\delta_3^2 + ([A]_{s_2}^{R_0})^2) \int_{Q_{540r}(x_3, t_0)} |\nabla u|^2 dx dt + c_{12} (\delta_3^2 + 1 + ([A]_{s_2}^{R_0})^2) \int_{Q_{540r}(x_3, t_0)} |F|^2 dx dt. \end{aligned}$$

Since $\mathcal{M}(|\nabla u|^2)(x_1, t_1) \leq \lambda$, $\mathcal{M}(|F|^2)(x_2, t_2) \leq \delta_2 \lambda$ and (3.8), (3.9) we get

$$\begin{aligned} \|\nabla V\|_{L^\infty(Q_{10r}(x_3, t_0))}^2 &\leq c_{13} \int_{\tilde{Q}_{1089r}(x_1, t_1)} |\nabla u|^2 dx dt + c_{13} \int_{\tilde{Q}_{1089r}(x_1, t_1)} |F|^2 dx dt \\ &\leq c_{14} (1 + \delta_2) \lambda \\ &\leq c_{15} \lambda, \end{aligned}$$

and

$$\begin{aligned} \int_{Q_{10r}(x_3, t_0)} |\nabla u - \nabla V|^2 dx dt &\leq c_{16} ((\delta_3^2 + ([A]_{s_2}^{R_0})^2) + (\delta_3^2 + 1 + ([A]_{s_2}^{R_0})^2) \delta_2) \lambda \\ &\leq c_{16} ((\delta_3^2 + \delta_1^2) + (\delta_3^2 + 1 + \delta_1^2) \delta_2) \lambda. \end{aligned} \quad (3.10)$$

Notice that we have used $[A]_{s_0}^{R_0} \leq \delta_1$ in the last inequality. Now set $\Lambda = \max\{3^{N+2}, 4c_7, 4c_{15}\}$. As above we also have

$$|E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)| \leq |\{\mathcal{M}(\chi_{\tilde{Q}_{2r}(x, t)} |\nabla u - \nabla V|^2) > \Lambda\lambda/4\} \cap \tilde{Q}_r(x, t)|.$$

Therefore using (3.10) we obtain

$$\begin{aligned} |E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)| &\leq \frac{c_{17}}{\lambda} \int_{\tilde{Q}_{2r}(x, t)} |\nabla u - \nabla V|^2 dx dt \\ &\leq c_{18} ((\delta_3^2 + \delta_1^2) + (\delta_3^2 + 1 + \delta_1^2) \delta_2) |\tilde{Q}_r(x, t)|. \end{aligned}$$

Thus

$$\begin{aligned} w(E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)) &\leq C \left(\frac{|E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)|}{|\tilde{Q}_r(x, t)|} \right)^\nu w(\tilde{Q}_r(x, t)) \\ &\leq C (c_{18} ((\delta_3^2 + \delta_1^2) + (\delta_3^2 + 1 + \delta_1^2) \delta_2))^\nu w(\tilde{Q}_r(x, t)) \\ &< \varepsilon w(\tilde{Q}_r(x, t)), \end{aligned}$$

where $\delta_3, \delta_1, \delta_2$ are appropriately chosen and $(C, \nu) = [w]_{\mathbf{A}_\infty}$. Therefore, for all $(x, t) \in \Omega_T$, $r \in (0, 2r_0]$ and $\lambda > 0$, if

$$w(E_{\lambda, \delta_2} \cap \tilde{Q}_r(x, t)) \geq \varepsilon w(\tilde{Q}_r(x, t)),$$

then

$$\tilde{Q}_r(x, t) \cap \Omega_T \subset F_\lambda,$$

where $\delta_1 = \delta_1(N, \Lambda_1, \Lambda_2, \varepsilon, [w]_{\mathbf{A}_\infty}) \in (0, 1)$ and $\delta_2 = \delta_2(N, \Lambda_1, \Lambda_2, \varepsilon, [w]_{\mathbf{A}_\infty}, T_0/R_0) \in (0, 1)$. Combining this with (3.2), we can apply Lemma 3.2 to get the result. \blacksquare

Proof of Theorem 1.1. By Theorem 3.1, for any $\varepsilon > 0$, $R_0 > 0$ one finds $\delta = \delta_1(N, \Lambda_1, \Lambda_2, \varepsilon, [w]_{\mathbf{A}_\infty}) \in (0, 1/2)$ and $\delta_2 = \delta_2(N, \Lambda_1, \Lambda_2, \varepsilon, [w]_{\mathbf{A}_\infty}, T_0/R_0) \in (0, 1)$ and $\Lambda = \Lambda(N, \Lambda_1, \Lambda_2) > 0$, $s_0 = s_0(N, \Lambda_1, \Lambda_2)$ such that if Ω is a (δ, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta$ then

$$w(\{\mathcal{M}(|\nabla u|^2) > \Lambda\lambda, \mathcal{M}(|F|^2) \leq \delta_2\lambda\} \cap \Omega_T) \leq B\varepsilon w(\{\mathcal{M}(|\nabla u|^2) > \lambda\} \cap \Omega_T), \quad (3.11)$$

for all $\lambda > 0$, where the constant B depends only on $N, \Lambda_1, \Lambda_2, T_0/R_0, [w]_{\mathbf{A}_\infty}$. Thus, for $s < \infty$,

$$\begin{aligned} \|\mathcal{M}(|\nabla u|^2)\|_{L_w^{q,s}(\Omega_T)}^s &= q\Lambda^s \int_0^\infty \lambda^s (w(\{\mathcal{M}(|\nabla u|^2) > \Lambda\lambda\} \cap \Omega_T))^{s/q} \frac{d\lambda}{\lambda} \\ &\leq q\Lambda^s 2^{s/q} (B\varepsilon)^{s/q} \int_0^\infty \lambda^s (w(\{\mathcal{M}(|\nabla u|^2) > \lambda\} \cap \Omega_T))^{s/q} \frac{d\lambda}{\lambda} \\ &\quad + q\Lambda^s 2^{s/q} \int_0^\infty \lambda^s (w(\{\mathcal{M}(|F|^2) > \delta_2\lambda\} \cap \Omega_T))^{s/q} \frac{d\lambda}{\lambda} \\ &= \Lambda^s 2^{s/q} (B\varepsilon)^{s/q} \|\mathcal{M}(|\nabla u|^2)\|_{L_w^{q,s}(\Omega_T)}^s + \Lambda^s 2^{s/q} \delta_2^{-s} \|\mathcal{M}(|F|^2)\|_{L_w^{q,s}(\Omega_T)}^s. \end{aligned}$$

It implies

$$\|\mathcal{M}(|\nabla u|^2)\|_{L_w^{q,s}(\Omega_T)} \leq 2^{1/s} \Lambda 2^{1/q} (B\varepsilon)^{1/q} \|\mathcal{M}(|\nabla u|^2)\|_{L_w^{q,s}(\Omega_T)} + 2^{1/s} \Lambda 2^{1/q} \delta_2^{-1} \|\mathcal{M}(|F|^2)\|_{L_w^{q,s}(\Omega_T)}$$

and this inequalities is also true when $s = \infty$.

We can choose $\varepsilon = \varepsilon(N, \Lambda, s, q, B) > 0$ such that $2^{1/s} \Lambda 2^{1/q} (B\varepsilon)^{1/q} \leq 1/2$, then we get the result. \blacksquare

Proof of Theorem 1.3. We recall that $A(x, t, \xi) = A(x, t)\xi$ where $A(x, t)$ is a matrix.

a. Fix $q > 2, 0 < s \leq \infty, w \in \mathbf{A}_{q/2}$. Assume $\|F\|_{L_w^{q,s}(\Omega_T)} < \infty$. So, $F \in L^2(\Omega_T, \mathbb{R}^N)$ and problem (1.8) with $\mu \equiv 0, \sigma \equiv 0$ has a unique weak solution $v_1 \in L^2(0, T, H_0^1(\Omega))$. By Theorem 1.2, we find a $\delta_1 = \delta_1(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}) \in (0, 1)$ such that if Ω is a (δ_1, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta_1$ for some $R_0 > 0$ then

$$\|\nabla v_1\|_{L_w^{q,s}(\Omega_T)} \leq c_1 \|F\|_{L_w^{q,s}(\Omega_T)}, \quad (3.12)$$

where $c_1 = c_1(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}, T_0/R_0)$.

Moreover, by [19, Theorem 2.20], there exists a distribution solution $v_2 \in L^1(0, T, W_0^{1,1}(\Omega))$ of (1.8) with $F \equiv 0$ and $\delta_2 = \delta_2(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}) \in (0, 1)$ such that if Ω is a (δ_2, R_0) -Reifenberg flat and $[A]_{s_0}^{R_0} \leq \delta_2$ for some $R_0 > 0$, then there holds

$$\|\nabla v_2\|_{L_w^{q,s}(\Omega_T)} \leq c_2 \|\mathcal{M}_1[\omega]\|_{L_w^{q,s}(\Omega_T)}, \quad (3.13)$$

where $c_2 = c_2(N, \Lambda_1, \Lambda_2, q, s, [w]_{\mathbf{A}_{q/2}}, T_0/R_0)$. In particular, $v_2 \in L^2(0, T, H_0^1(\Omega))$.

Obviously, $u := v_1 + v_2$ is a unique weak solution of (1.8) in $L^2(0, T, H_0^1(\Omega))$ and from (3.12)-(3.13) we obtain (1.9) where Ω is a (δ, R_0) -flat and $[A]_{s_0}^{R_0} \leq \delta$ with $\delta = \min\{\delta_1, \delta_2\}$.

b. Using the previous argument, we only show statement **b** in case $\mu \equiv 0, \sigma \equiv 0$.

Fix $\varepsilon \in (0, 1), \frac{2(\varepsilon+1)}{\varepsilon+2} < q \leq 2, 0 < s \leq \infty, w^{2+\varepsilon} \in \mathbf{A}_1$ and assume $\mathcal{M}_1[\omega], |F| \in L_w^{q,s}(\Omega_T)$. Set $p = \frac{2(\varepsilon+1)}{\varepsilon+2}$.

b.1. We prove that there is a $\delta_3 = \delta_3(N, \Lambda_1, \Lambda_2, \varepsilon) \in (0, 1)$ such that if Ω is a (δ, R_0) -Reifenberg flat domain for some $R_0 > 0$, then problem (1.8) with $\mu \equiv 0, \sigma \equiv 0$ has a unique weak solution $v_3 \in L^p(0, T, W_0^{1,p}(\Omega))$.

Clearly, if $A^*(x, t, \xi) = A^*(x, t)\xi$, where $A^*(x, t)$ is the transposed matrix of $A(x, t)$ then A^* satisfies (1.2) and (1.3) with the same constants and $[A^*]_{s_0}^{R_0} = [A]_{s_0}^{R_0}$.

By Theorem 1.2 there exists $\delta_3 = \delta_3(N, \Lambda_1, \Lambda_2, \varepsilon) \in (0, 1)$ such that if Ω is (δ_3, R_0) -flat and $[A]_{s_0}^{R_0} \leq \delta_3$ for some $R_0 > 0$ there holds

$$\|\nabla \varphi\|_{L^{p'}(\Omega_T)} \leq c_3 \|G\|_{L^{p'}(\Omega_T)} \quad \forall G \in C^\infty(\overline{\Omega_T}, \mathbb{R}^N), \quad (3.14)$$

for some constant c_3 , where φ is a unique solution to the problem

$$\begin{cases} -\varphi_t - \operatorname{div}(A^*(x, t)\nabla \varphi) = \operatorname{div}(G) & \text{in } \Omega_T, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(T) = 0 & \text{in } \Omega. \end{cases} \quad (3.15)$$

Let $F_n \in C_c^\infty(\Omega_T, \mathbb{R}^N)$ converge to F in $L^p(\Omega_T, \mathbb{R}^N)$ and u_n be a solution of problem (1.8) with $F = F_n$ and $\mu \equiv 0, \sigma \equiv 0$. We can choose φ for test function,

$$\begin{aligned} - \int_{\Omega_T} \nabla u_n G dx dt &= - \int_{\Omega_T} u_n \varphi_t dx dt + \int_{\Omega_T} A^*(x, t) \nabla \varphi \nabla u_n dx dt \\ &= - \int_{\Omega_T} u_n \varphi_t dx dt + \int_{\Omega_T} A(x, t) \nabla u_n \nabla \varphi dx dt \\ &= - \int_{\Omega_T} \nabla \varphi F_n. \end{aligned}$$

Using Hölder inequality and (3.14) yield

$$\left| \int_{\Omega_T} \nabla u_n G dx dt \right| \leq c_3 \|G\|_{L^{p'}(\Omega_T)} \|F_n\|_{L^p(\Omega_T)} \quad \forall G \in C^\infty(\overline{\Omega_T}, \mathbb{R}^N),$$

it implies

$$|||\nabla u_n|||_{L^p(\Omega_T)} \leq c_3 |||F_n|||_{L^p(\Omega_T)}.$$

By linearity of A we get

$$|||\nabla u_n - \nabla u_m|||_{L^p(\Omega_T)} \leq c_3 |||F_n - F_m|||_{L^p(\Omega_T)} \rightarrow 0 \text{ as } n, m \rightarrow \infty.$$

Thus, u_n converges to some function v_3 in $L^p(0, T, W_0^{1,p}(\Omega))$. Obviously, v_3 is a unique weak solution in $L^p(0, T, W_0^{1,p}(\Omega))$ of problem (1.8) with $\mu \equiv 0, \sigma \equiv 0$.

b.2. Set $\bar{w}(x, t) = (w(x, t))^{-\frac{1}{p-1}}$. We have $\bar{w} \in \mathbf{A}_{p'/2}$ and $[\bar{w}]_{\mathbf{A}_{p'/2}} = [w^{2+\varepsilon}]_{\mathbf{A}_{1+\varepsilon}}^{\frac{1}{\varepsilon}} \leq [w^{2+\varepsilon}]_{\mathbf{A}_1}^{\frac{1}{\varepsilon}}$. By Theorem 1.2 there exists $\delta_4 = \delta_4(N, \Lambda_1, \Lambda_2, \varepsilon, [w^{2+\varepsilon}]_{\mathbf{A}_1}) \in (0, 1)$ such that if Ω is (δ_4, R_0) -flat and $[A]_{s_0}^{R_0} \leq \delta_4$ for some $R_0 > 0$ there holds

$$|||\nabla \varphi|||_{L_{\frac{p'}{w}}(\Omega_T)} \leq c_4 |||G|||_{L_{\frac{p'}{w}}(\Omega_T)} \quad \forall G \in C^\infty(\bar{\Omega}_T, \mathbb{R}^N), \quad (3.16)$$

where φ is a unique solution to problem (3.15) and $c_4 = c_4(N, \Lambda_1, \Lambda_2, \varepsilon, [w^{2+\varepsilon}]_{\mathbf{A}_1})$. Using $\int_{\Omega_T} \nabla u G dx dt = \int_{\Omega_T} \nabla \varphi F$, Hölder inequality and (3.16) we find

$$|\int_{\Omega_T} \nabla u G dx dt| \leq c_4 |||F|||_{L_w^p(\Omega_T)} |||G|||_{L_{\frac{p'}{w}}(\Omega_T)} \quad \forall G \in C^\infty(\bar{\Omega}_T, \mathbb{R}^N).$$

Thus, we obtain

$$|||\nabla u|||_{L_w^p(\Omega_T)} \leq c_4 |||F|||_{L_w^p(\Omega_T)}.$$

On the other hand, by statement **a** there exist $\delta_5 = \delta_5(N, \Lambda_1, \Lambda_2, [w^{2+\varepsilon}]_{\mathbf{A}_1}) \in (0, 1)$ such that if Ω is (δ_5, R_0) -flat and $[A]_{s_0}^{R_0} \leq \delta_5$ for some $R_0 > 0$ there holds

$$|||\nabla u|||_{L_w^3(\Omega_T)} \leq c_5 |||F|||_{L_w^3(\Omega_T)}.$$

for some $c_5 = c_5(N, \Lambda_1, \Lambda_2, \varepsilon, [w^{2+\varepsilon}]_{\mathbf{A}_1})$. We now denote map $\mathcal{J} : (L_w^p(\Omega_T))^N \rightarrow L_w^p(\Omega_T)$ by $\mathcal{J}(f) := |\nabla v|$ for any $f \in (L_w^p(\Omega_T))^N$ where v is the unique weak solution of problem (1.8) with $\mu \equiv 0, \sigma \equiv 0$ and $F = f$. We see that \mathcal{J} is a sublinear operator and

$$|||\mathcal{J}(f_1)|||_{L_w^3(\Omega_T)} \leq c_5 |||f_1|||_{L_w^3(\Omega_T)} \quad \forall f_1 \in (L_w^3(\Omega_T))^N$$

and

$$|||\mathcal{J}(f_2)|||_{L_w^p(\Omega_T)} \leq c_4 |||f_2|||_{L_w^p(\Omega_T)} \quad \forall f_2 \in (L_w^p(\Omega_T))^N$$

where Ω is (δ, R_0) -Reifenberg flat and $[A]_{s_0}^{R_0} \leq \delta$ with $\delta = \min\{\delta_4, \delta_5\}$. Thank to the interpolation Theorem, see [7, Theorem 1.4.19] we get the statement **b**. This completes the proof. \blacksquare

4 Quasilinear Riccati type parabolic equations

To prove Theorem 1.5 we need the following Lemma:

Lemma 4.1 *Let $\gamma \geq 1$ and H_1, H_2 be measurable functions in \mathbb{R}^N . If*

$$\int_{\Omega_T} |H_1| w dx dt \leq C(\gamma, [w^\gamma]_{\mathbf{A}_1}) \int_{\Omega_T} |H_2| w dx dt \quad \forall w^\gamma \in \mathbf{A}_1,$$

then for any $p > \frac{(N+2)(\gamma-1)}{\gamma}$,

$$[|H_1|]_{\text{Cap}_{\mathcal{G}_1, p}} \leq C[|H_2|]_{\text{Cap}_{\mathcal{G}_1, p}},$$

where $C = C(N, p, \gamma, T_0)$, for measurable function H in \mathbb{R}^N , $[H]_{\text{Cap}_{\mathcal{G}_1, p}}$ is denoted by

$$[|H|]_{\text{Cap}_{\mathcal{G}_1, p}} = \sup \frac{\int_K |H| dx dt}{\text{Cap}_{\mathcal{G}_1, p}(K)},$$

the suprema being taken over all compact sets $K \subset \mathbb{R}^{N+1}$.

Its proof can be found in [19, Proof of Propostion 4.24]. Using this Lemma we obtain

Theorem 4.2 *Suppose that A is linear. Let $F \in L^1(\Omega_T, \mathbb{R}^N)$, $\mu \in \mathfrak{M}_b(\Omega_T)$, $\sigma \in \mathfrak{M}_b(\Omega)$, set $\omega = |\mu| + |\sigma| \otimes \delta_{\{t=0\}}$. Let s_0 be in Theorem 1.1.*

- a.** *For any $q > 1$ and $\mathcal{M}_1[\omega], \mathcal{M}(|F|^2)^{1/2} \in L^q(\Omega_T)$ we find $\delta = \delta(N, \Lambda_1, \Lambda_2, q) \in (0, 1)$ such that if Ω is a (δ, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta$ for some $R_0 > 0$ then there exists a unique weak solution $u \in L^q(0, T, W_0^{1, q})$ of (1.8) and there holds*

$$[|\nabla u|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq C_1 \left[(\mathcal{M}(|F|^2))^{q/2} \chi_{\Omega_T} \right]_{\text{Cap}_{\mathcal{G}_1, q'}} + C_1 [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \quad (4.1)$$

where $C_1 = C_1(N, \Lambda_1, \Lambda_2, q, T_0/R_0, T_0)$.

- b.** *For any $1 < q < \frac{N+2}{N}$ and $\mathcal{M}_1[\omega], |F| \in L^q(\Omega_T)$ we find $\delta = \delta(N, \Lambda_1, \Lambda_2, q) \in (0, 1)$ such that if Ω is a (δ, R_0) -flat domain and $[A]_{s_0}^{R_0} \leq \delta$ for some $R_0 > 0$ then there exists a unique weak solution $u \in L^q(0, T, W_0^{1, q}(\Omega))$ of (1.8) and there holds*

$$[|\nabla u|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq C_2 [F^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} + C_2 [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \quad (4.2)$$

where $C_2 = C_2(N, \Lambda_1, \Lambda_2, q, T_0/R_0, T_0)$.

Proof. We have

$$[(\mathcal{M}_1[\omega])^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq c [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q,$$

where $c = c(N, q, T_0)$, see [19, Corollary 4.39]. Therefore, thanks to Theorem 1.1, 1.3 and Lemma 4.1 we get the results. \blacksquare

Proof of Theorem 1.5. By Theorem 4.2, there exists $\delta = \delta(N, \Lambda_1, \Lambda_2, q) \in (0, 1)$ such that Ω is (δ, R_0) -Reifenberg flat domain and $[A]_{s_0}^{R_0} \leq \delta$ for some R_0 and a sequence $\{u_n\}_n$ obtained by induction of the weak solutions of

$$\begin{cases} (u_1)_t - \text{div}(A(x, t, \nabla u_1)) = \text{div}(F) + \mu & \text{in } \Omega_T, \\ u_1 = 0 & \text{on } \partial\Omega \times (0, T), \\ u_1(0) = \sigma & \text{in } \Omega, \end{cases}$$

and

$$\begin{cases} (u_{n+1})_t - \text{div}(A(x, t, \nabla u_{n+1})) = |\nabla u_n|^q + \text{div}(F) + \mu & \text{in } \Omega_T, \\ u_{n+1} = 0 & \text{on } \partial\Omega \times (0, T), \\ u_{n+1}(0) = \sigma & \text{in } \Omega, \end{cases}$$

for any which satisfy

$$[|\nabla u_{n+1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq c [H_q]_{\text{Cap}_{\mathcal{G}_1, q'}} + c [|\nabla u_n|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}}^q + c [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \quad \forall n \geq 0, \quad (4.3)$$

where $u_0 \equiv 0$ and the constant c depends only on $N, \Lambda_1, \Lambda_2, q$ and $T_0/R_0, T_0$. Since, $u_{n+1} - u_n$ is the unique weak solution of

$$\begin{cases} u_t - \text{div}(A(x, t, \nabla u)) = |\nabla u_n|^q - |\nabla u_{n-1}|^q & \text{in } \Omega_T, \\ u = 0 & \text{on } \partial\Omega \times (0, T), \\ u(0) = 0 & \text{in } \Omega, \end{cases} \quad (4.4)$$

we have

$$[|\nabla u_{n+1} - \nabla u_n|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq c [|\nabla u_n|^q - |\nabla u_{n-1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}}^q, \quad \forall n \geq 0. \quad (4.5)$$

If

$$[H_q]_{\text{Cap}_{\mathcal{G}_1, q'}} + [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \leq \frac{q-1}{(cq)^{q'}}, \quad (4.6)$$

then from (4.3) we can show that

$$[|\nabla u_n|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq cq' \left([H_q]_{\text{Cap}_{\mathcal{G}_1, q'}} + [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \right) \quad \forall n \geq 1. \quad (4.7)$$

Using Hölder inequality and (4.5) yield

$$\begin{aligned} [|\nabla u_{n+1} - \nabla u_n|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} &\leq cq [|\nabla u_n - \nabla u_{n-1}|(|\nabla u_n|^{q-1} + |\nabla u_{n-1}|^{q-1}) \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \\ &\leq cq [|\nabla u_n - \nabla u_{n-1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \left[(|\nabla u_n|^{q-1} + |\nabla u_{n-1}|^{q-1})^{q'} \chi_{\Omega_T} \right]_{\text{Cap}_{\mathcal{G}_1, q'}}^{q-1} \\ &\leq cq 2^{q'-1} [|\nabla u_n - \nabla u_{n-1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \left([|\nabla u_n|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}}^{q-1} + [|\nabla u_{n-1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}}^{q-1} \right). \end{aligned}$$

Hence, by (4.6)-(4.7) we find

$$\begin{aligned} [|\nabla u_{n+1} - \nabla u_n|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} &\leq cq 2^{q'-1} (cq')^{q-1} \left([H_q]_{\text{Cap}_{\mathcal{G}_1, q'}} + [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \right)^{q-1} [|\nabla u_n - \nabla u_{n-1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \\ &\leq \frac{1}{2} [|\nabla u_n - \nabla u_{n-1}|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}}, \end{aligned}$$

provided that

$$[H_q]_{\text{Cap}_{\mathcal{G}_1, q'}} + [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \leq \min \left\{ (cq' 2^{q'+1} (cq')^{q-1})^{-\frac{1}{q-1}}, \frac{q-1}{(cq)^{q'}} \right\}. \quad (4.8)$$

Hence, if (4.8) holds, u_n converges to $u = u_1 + \sum_{n=1}^{\infty} (u_{n+1} - u_n)$ in $L^q(0, T, W_0^{1,q}(\Omega))$ satisfying

$$[|\nabla u|^q \chi_{\Omega_T}]_{\text{Cap}_{\mathcal{G}_1, q'}} \leq cq' \left([H_q]_{\text{Cap}_{\mathcal{G}_1, q'}} + [\omega]_{\text{Cap}_{\mathcal{G}_1, q'}}^q \right).$$

Obviously, u is a weak solution of problem (1.15). This completes the proof. \blacksquare

Acknowledgements: The author wishes to express his deep gratitude to Professor Laurent Véron and Professor Marie-Françoise Bidaut-Véron for encouraging, taking care and giving many useful comments during the preparation of the paper. Besides, the author would like to thank the anonymous referee for giving many remarks about the papers [5, 8, 16, 17].
